SUMMARY

Backend-focused Full-Stack Developer and Computing Science student with real-world experience building scalable web applications using Java, Python, Node.js, SQL, and Supabase. Strong in backend development, API design, authentication, and database management, with supporting frontend experience in React and React Native. Seeking a software development internship or junior role with opportunities for backend ownership and growth.

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, SQL, PHP, C++, C#, Rust

Backend: Node.js, Supabase, REST APIs, Laravel, Maven

Databases: PostgreSQL, SQL

Frontend: React, React Native, HTML, CSS, Tailwind, Vue, Flutter

Cloud/Tools: Netlify, Render, Git, GitHub

EDUCATION

Bachelor of Science in Computing Science, Specialization: Software Development

The King's University, Edmonton, AB, Canada

2021 – 2026

PROFESSIONAL EXPERIENCE

Software Developer/Engineer Addad Media, Remote

April 2025 – August 2025

- Built and deployed admin-facing full-stack applications using React (Expo) and Supabase (PostgreSQL, authentication, APIs) to support kiosk management and admin-user interactions.
- Designed backend data models and integrated secure API endpoints to improve admin control, data consistency, and system reliability across kiosk operations.
- Implemented reusable component structures and shared design systems for internal admin tools, improving maintainability and development efficiency.
- Collaborated within a 4-member agile team, contributing to sprint planning, stand-ups, and demos while independently owning assigned features from development through testing.
- Maintained clean, version-controlled code using Git, adhering to best practices for security, performance, and scalability.

Software Developer Dunamis Chapel, Edmonton, AB

January 2025 – April 2025

- Built event registration/check-in system using Node.js (Express) + PostgreSQL, designing normalized data models and API endpoints handling 100+ user registrations per event, reducing manual tracking time
- Implemented JWT authentication and Role-Based Access Control (RBAC) with protected routes and middleware-based permission checks
- Developed admin dashboard using React, TypeScript, Tailwind CSS, enabling real-time attendance tracking and CSV export
- Designed REST APIs for event creation, user registration, and check-in validation with input validation and error handling
- Delivered 2 production websites (React + Node.js) with CMS features, media handling, and donation integrations
- Implemented bilingual content rendering (EN/FR) using dynamic content mapping
- Deployed applications via Render + Netlify, managing environment configs and production builds

Full Stack Software Developer Ts Diamond Consulting Inc , Remote

July 2023 – March 2024

- Built full-stack applications using React, Node.js (Express), PostgreSQL, structuring backend into modular service layers
- Developed RESTful APIs with request validation, error handling, and database abstraction
- Implemented JWT authentication and Role-Based Access Control (RBAC) for multi-role systems
- Built modules for approval workflows, dashboards, and advanced search/filtering across relational datasets which reduced manual data processing time for internal operations
- Used Python for backend automation, including data cleaning, transformation, and report generation
- Optimized performance through SQL query tuning, indexing, and efficient schema design
- Debugged cross-stack issues and maintained code using Git/GitHub in an Agile workflow

Software Development Instructor STEM Education Platform, Edmonton, AB

September 2022 – July 2023

- Designed and delivered a hands-on computer science and Java programming curriculum, guiding students through core concepts including object-oriented programming, data structures, and API integration using Eclipse and IntelliJ IDEA.
- Taught Java (OOP, collections, exception handling) using IntelliJ/Eclipse with hands-on projects
- Guided students in building applications integrating REST APIs (HTTP + JSON)
- Introduced Maven for dependency management and project structure
- Mentored students through debugging, code reviews, and clean architecture practices

Software Developer Daughters of Zion Women Foundation, Edmonton, AB

January 2020 – June 2022

- Engineered and maintained software systems that supported operational workflows, data management, reporting, and digital service delivery
- Built internal systems using Node.js and PostgreSQL, supporting workflows, reporting, and user data management
- Developed REST APIs for record management, workflow tracking, and role-based system interactions
- Implemented Role-Based Access Control (RBAC) and validation logic for secure multi-user access
- Used Java (OOP, collections) to develop structured modules and utilities for data processing and system logic
- Developed lightweight backend/admin tools using PHP for form handling and server-side processing
- Applied C++/C# for performance-focused utilities and algorithmic components, supporting data handling and internal processing tasks
- Designed relational database schemas and optimized queries for efficient data retrieval
- Contributed to system testing, debugging, and deployment of maintainable applications

PERSONAL PROJECTS

Bakery Delivery - Bakery Route Planning & Driver Operations Platform (MVP):

- Built a mobile delivery operations platform using Flutter, Supabase Auth, PostgreSQL, and Google Maps APIs
- Implemented admin workflows for delivery plan creation, route assignment, employee management, stop monitoring, and time record review
- Designed driver workflows for shift tracking, vehicle-capacity-based load batching, optimized route execution, invoice confirmation, and return-to-bakery cycles
- Integrated Google Places autocomplete and Google Directions optimization to improve address entry and delivery sequencing
- Built role-based access control, Supabase Row Level Security policies, and structured relational data models for multi-user delivery coordination
- Developed responsive admin/driver interfaces and automated tests for route assignment, load selection, monitoring summaries, and authentication flows

Portfolio Website v2- Built a modern portfolio website designed to showcase my work:

- Built interactive portfolio using React, TypeScript, Tailwind CSS with component-based architecture
- Implemented dynamic project demos, code snippet switching, and animated UI transitions
- Designed responsive layout system for cross-device performance and scalable content management

JumpshotTrainer v2- Real-Time AI Basketball Form Analysis System (Prototype):

- Architected AI pipeline using Python (MediaPipe, OpenCV) + Rust for high-performance processing
- Built data pipelines for pose estimation, motion tracking, and shot analysis
- Designed system for real-time feedback and scalable model integration for live camera input

Tadester Ops - Route Optimization & Job Mapping Platform for Field Services (MVP):

- Built full-stack platform using Flutter (mobile), Node.js (Express), React, PostgreSQL
- Implemented route optimization logic and job scheduling algorithms for field operations reduced travel inefficiencies in job scheduling workflows
- Designed Role-Based Access Control (RBAC) and real-time task tracking for multi-user coordination
- Integrated backend APIs and structured data models for multi-job management and routing workflows
- Set up CI/CD pipeline with GitHub Actions, deploying to Render (backend) and Netlify (frontend)
- Designed System supporting multi-job coordination and real-time task tracking for field users.
